

WHO WE ARE

Published monthly by the Pennsylvania Rural Electric Association (PREA), the service organization for the Pennsylvania-based rural electrical cooperatives, *Penn Lines* magazine serves as the flagship publication for cooperative communications efforts. With a circulation of nearly 166,000 subscribers, *Penn Lines* magazine reaches homes and businesses in 42 Pennsylvania counties. In publication since October 1966, *Penn Lines* magazine has a long and respected history with its readers.

MISSION

In keeping with the principles of the cooperative business model, *Penn Lines* magazine serves to educate and inform its readers of issues and events affecting their communities and way of life.

EDITORIAL FOCUS

Penn Lines is “the magazine you come home to.” For more than 50 years, it has served as the voice of rural Pennsylvania. Its in-depth reporting on issues affecting rural residents and their quality of life has earned *Penn Lines* a long history of loyal readership. At its heart, *Penn Lines* is a hometown publication, focusing on local communities and the people who live in them. Along with energy news and information, each issue is packed with feature stories, familiar columns, and reporting that speaks to life in rural Pennsylvania.

SERVICE AREA

Penn Lines magazine is delivered each month to the cooperative consumer-members through their local rural electric cooperative and to PREA associate members. In addition the magazine is available online to anyone with internet access at www.prea.com. Most importantly, each participating individual cooperative is represented in the magazine’s center spread. Here, the readers learn about local cooperative news and events, as well as happenings in their communities and surrounding areas.

PENNSYLVANIA RURAL ELECTRIC COOPERATIVE ORIGIN

As late as the mid-1930s, electricity was still out of reach for more than 90 percent of Pennsylvania rural residents. Private power companies did not find it profitable to provide electricity to these areas so rural residents banded together and provided their own electricity through community-based rural electric cooperatives. Since rural Pennsylvania electric service first began flowing in 1937, 13 Pennsylvania-based rural electric cooperatives have been formed and continue to provide safe, reliable, and affordable electric service to more than 200,000 rural homes and businesses.

2022 EDITORIAL CALENDAR*

JANUARY

PREA 80th Anniversary — **PLUS** — Way Off the Beaten Path: The Extra-Miler Club

FEBRUARY

Federal Infrastructure Measure and Its Impact on Rural Areas — **PLUS** — The Plight of Rural Hospitals

DIGITAL SPECIFICATIONS

DIGITAL FILE FORMATS:

PREFERRED:

- PDF format. These should be saved using the setting PDF/X-1a or PDF/X1a:2001. These are standard file formats for high-end printing purposes.

ACCEPTABLE:

- EPS or TIFF (with all fonts embedded or supplied).
- InDesign, Adobe Photoshop, Adobe Illustrator

When submitting acceptable file types (except PDF files) the following must be provided:

- Layout file of final version of ad
 - All fonts used in the ad; including fonts used in .eps files
 - All art/logo files used in the ad (tiff, eps)
 - A hardcopy printout of final ad; fax when emailing digital file
- Microsoft Word and Microsoft Publisher are not acceptable file formats.*

DESIGN GUIDELINES:

TRANSPARENCIES

All transparencies *must* be flattened prior to ad/file submission. Our digital guidelines require a PDF file to be created under the PDF/X1-a specification. The PDF/X1-a specification is the standard for the printing and publishing industry and is designed to provide the most reliable printed results possible. Because of the variables involved in transparency, transparency is not included in this specification and therefore all transparency must be flattened prior to submitting digital files. Transparency flattening is the process in which transparent objects are “flattened,” thereby combining the various layers into a single layer, but preserving the transparency of the objects. During flattening, the objects that are affected by transparency are examined by the application’s flattening engine and broken into separate elements. Some of these elements remain vectors and others are rasterized. Each file can be rendered differently, causing color shifts, rasterized type and artifacting (small white gaps between a vector and rastered object). Given these variables, flattening is a subjective process and therefore it is important that advertisers or designers flatten all files prior to submitting digital files.

COLORS

- All spot colors, including Pantone and RGB colors, *must* be converted to process (CMYK). RGB files should not be submitted.
- The total ink density of any color must not exceed 290% ink density.

FONTS

To minimize possible registration problems, below are the recommended minimum type specifications for all ad files:

- Knockout type should be larger than 5pt and should only knockout of one or two colors. Type 5pt or smaller should overprint.
- Minimum type to knockout of a 4C image is 8pt. Type should never knockout a 4C black.
- Black type should always be set to 100K (100K, 40C for rich black) and set to overprint.
- All vector elements within a file will be trapped to ensure proper registration. Type or other elements knocking out of continuous tone images are not trapped, and thus should be avoided.
- Type must not have artificial styles applied in the page layout program. The actual (bold or italic) font must be selected.
- White/reverse type should be set to knockout, not overprint.

PHOTOGRAPHIC/CONTINUOUS TONE IMAGES

- Images should be saved in TIFF or EPS format (not JPEG) using Binary encoding and must not contain extra channels.
- The color space should be CMYK or Grayscale, not RGB or spot color. Images in black & white ads must be Grayscale.
- The effective resolution of images should be between 250 and 400 dpi. Effective resolution is the resolution at which the image was scanned/created, divided by the scale at which it is used in your layout application. For example, an image scanned/created to an output resolution of 300 dpi and used at 75% would have an effective resolution of $300 / 0.75 = 400$. Images from the web are 72 dpi, RGB and are not suitable for printing purposes.

LINework IMAGES

- Images should be saved as a bitmap TIFF.
- Effective resolution should be a minimum of 300 dpi.

VECTOR ARTWORK

- Vector artwork must be in EPS format.
- Fonts should be converted to outlines (preferred) or embedded within the EPS.
